Mathematics ... Learn how to solve mathematical proofs using This lecture introduces the proof strategy known as This video provides an introduction to the proof method of Strengthening and weakening statements, and $\forall x \exists y (P(x) \rightarrow Q(y))$ is not equivalent to $\exists y \forall x (P(x) \rightarrow Q(y))$. $\forall x \exists y (P(x) \rightarrow Q(y))$ is true if for every x there is a y such that $P(x) \rightarrow Q(y)$ is true. $\exists y \forall x (P(x) \rightarrow Q(y))$ is true if there is a y such that for every x , $P(x) \rightarrow Q(y)$ is true. For example, let $P(x)$ be " x is a person" and $Q(y)$ be " y is a doctor". $\forall x \exists y (P(x) \rightarrow Q(y))$ is true because for every person x , there is a doctor y such that if x is a person, then y is a doctor. $\exists y \forall x (P(x) \rightarrow Q(y))$ is false because there is no single doctor y such that for every person x , if x is a person, then y is a doctor.
