4. Contextual Analysis (Continued)

Continuing our detailed review of L 12 Osculating Plane Normal Plane Rectifying Plane LI Differential Geometry, we examine secondary source materials and community-driven data points:

separate from how the curve $\mathbf{r}(t)$ is defined. The osculating plane is the plane that best approximates the curve at a given point. It is the plane that contains the tangent vector $\mathbf{r}'(t)$ and the principal normal vector $\mathbf{n}(t)$. The normal plane is the plane perpendicular to the tangent vector $\mathbf{r}'(t)$. The rectifying plane is the plane perpendicular to the principal normal vector $\mathbf{n}(t)$.
